Dummy Keypad KD-100Q

The dummy keypad has flashing LEDs, emits a beep when keys are pressed, and features a professional-looking stainless steel housing–just like a real working keypad.

INSTALLATION

1. Remove the faceplate from the base by loosening then removing the two screws on the faceplate.
2. The base has battery compartments on both sides. The keypad can operate for 1 (one) year on 2 "AAA" batteries, and 2 (two) years on 4 batteries (AAA, not included).
3. Locate the mounting screw holes on the top and bottom edges of the keypad base.
4. Using the included screws, mount the keypad on an indoor or outdoor wall next to an entry door where it is clearly visible.
5. Replace the metal faceplate but make sure not to over-tighten the screws.
6. When the keypad beeps or LED flashes become weak, new batteries are needed.
